Coding Vocabulary

WORD MEANINGS

Read the meanings, then try using a new word in a sentence.

Algorithm
A set of steps for solving a problem or completing a task.

Variable
A named place for a value that a program can use and often change.

Function
A reusable section of code that carries out a particular task.

Loop
A structure that repeats a section of code.

Debug
To find and fix mistakes in a program.

Syntax
The rules for writing code in a particular programming language.

Boolean
A type of value with two possibilities: true or false.

Binary
A number system using only two digits: zero and one.

Input
Information given to a program or computer.

Output
Information or results produced by a program or computer.

Array
An ordered collection of values, usually accessed by numbered positions.

String
A sequence of characters, such as the letters in a name.

Event
An action or occurrence that a program can respond to, such as a click.

Compile
To translate code into another form, often before it is run.

Pixel
One of the small picture elements that make up a digital image.
